100200 240V AdBlue® Delivery System

Diesel vehicles with a Selective Catalytic Reduction system require periodic refilling with Adblue®.

To meet this demand, modern passenger vehicle & SUV workshops need equipment that's rapid, reliable and clean and with this point in mind the 100200 240V AdBlue® Delivery System has designed & manufactured to undertake the refilling of Adblue® automatically.

The new system, designed to meet the everyday needs of workshops, is easy to move around and allows Adblue® to be dispensed quickly and importantly safely into vehicles' tanks.

The 100200 includes a robust trolley on which a drum of Adblue® is installed and with the push of a button, the electric pump fills the vehicle with new Adblue® fluid.

The innovative closed filling system prevents vapour and smells from leaking out into the workshop environment therefore addressing WH&S concerns and protects the Adblue® from any external pollutants.

The air in the vehicle's tank is actually transferred to the tank of the 100200 when the vehicle is being refilled.

Flexible, easy to move and use, the 100200 240V AdBlue® Delivery System as manufactured in Italy, is a must for workshops aiming to save workshop technicians' time, simplify the ordering and storage of 20L AdBlue® drums, improve workshop productivity and to improve profitability.

PRODUCT SPECIFICATIONS, FEATURES AND BENEFITS

Allows rapid, reliable & clean delivery of Adblue® into diesel vehicles

Completely automatic, easy to use & reduces refilling times

Automatic shut off when tank is full

Adjustable flow rates from 3 to 11 L/min

A digital meter allows the operator to check the quantity of AdBlue® delivered

The universal connector is compatible with tanks of all vehicles

The trolley is compatible with 60L and 205L drums

Supplied complete with 2m delivery hose with ISO filling spout, digital control panel and flow meter

Manufactured in Italy

Drum not included

12V & 24V Battery versions for mobile refuelling c/w charger for mains recharging also available
